
Battle Royale Server Files Silkroad \\TOP\\

The simple answer is that no one can see every part of the universe at any moment. The easiest way to see this is that no one can see an object at the same moment that other observers see that object. So if one observer sees something move at Cm/s , then everyone else in the universe and the object isn't moving at Cm/s . They are at different speeds. So they all see the object move at a different speed. If they are different speeds, then it doesn't become detached from the surroundings because the surroundings aren't moving, and so the object moves with them, and isn't moving relative to the surroundings. So nothing is moving, and so nothing is being seen. If you imagine an universe with only 2 observers, then the observers see what others see (because only one thing can move at any moment), and so they each see only half the universe, and they each see the other half. But even though they see different things they still see the same things. We will see later why this is so, but for now we will just think of a sphere as an observer. We will divide the sphere into sections and think about how an observer can see what an other observer can see and what the other observer can see what he can see. And this lets you get your head around this. We will also think about how different observers see the same things at different speeds, and then we will conclude. Let us start with how observers can see which objects are in which section at different times. Firstly, they see which objects are where in their own section at that time. They don't see one object at that time, they see many objects. So they see a broad section of the sphere at any one time, but they don't see the exact object that is here at that moment. They see the closest object to it in their own section at that time. So they see that object in their own section at that moment, and even though they aren't seeing an exact object that isn't there, they see it. Now remember, we have said no one can see an object at the same time that everyone else sees the object. So no one sees a precise location at any one time. If no one is seeing an object, then no one is seeing that object in the exact same position. That means no one is seeing it. We have just ruled out the possibility of an observer seeing an object at the same time that everyone else is seeing the object. Since that is true, no one can see the exact time at which someone else is seeing it. So if no one is seeing it that exact time, then no one is seeing it.
